IAMPermit is the most comprehensive Electronic Permit software solution

Our electronic permit software is easy to use, requires no user training or installation, and can be configured to the specifics of your work control permit process.

★ IAMPermit Key Benefits

- ✓ **Answer in an instant** 'what work is taking place on plant right now, and what is happening in the next shift'
- ✓ **Anti clash capability** reduces risk from SIMOPS by displaying permits geographically with the use of Google Maps
- ✓ **Automated email notifications** drive the permit process
- ✓ **Clone historical permits** to issue new permits faster
- ✓ **Configurable templates** allow you to save any permit as a template for future use
- ✓ **On Screen tutorials** make using the software easy for all staff

A Permit-To-Work system is an integral part of a safe system of work and can help to properly manage a wide range of activities. Permits serve as a means of communication between site management, supervisors and operators and those that carry out the work.

Why A Software-Based Permit System?

Traditional, paper based, PTW systems introduce periods of delay in the communication - while permits are created, risk-assessed, handed over and executed.

IAMPermit, our software based Permit system, allows you to administer permits in real time, reducing these delays.

IAMPermit automatically communicates all relevant information to all personnel involved, bringing huge productivity improvement to your maintenance teams.

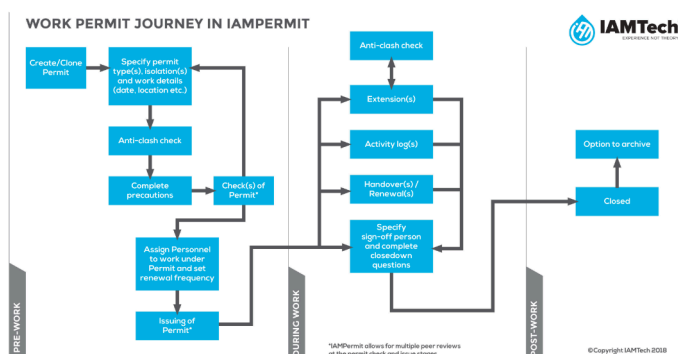

Customisation

We are able to modify the software to precisely match your permit workflow, standard or management procedure.

Compatible with

Our professional services team are available to integrate IAMPermit with SAP, Maximo or any other ERP you are using.

Summary

A responsible person should assess the work and check the safety at each stage. The people doing the job sign the permit to show that they understand the risks that could be encountered and the precautions necessary.

In paper format, permits need to be shared between persons in different site locations, which adds further delays to the permit life cycle. This can cause between 30 and 90 minutes a day of inactivity for any maintenance workers unable to commence until a permit is in place.

IAMPermit immediately flags any permit status changes to permit controllers via the cloud, reducing maintenance worker downtime.

If the job cannot be finished in one shift, IAMPermit will present the permit controller with a view allowing the permit to be administrated with a clear line of sight, continuing the safe state, and clear instructions are available for the next shift.

IAMPermit can also be integrated with our ISSOW (Integrated Safe System of Work).

IAMPermit

★ IAMPermit Key Features

Electronic Signatures: IAMPermit maintains a permanent record of who by and when the permit has been progressed. Signatures can be added by users at each stage of the permit process, and organizations can choose to make these mandatory or not.

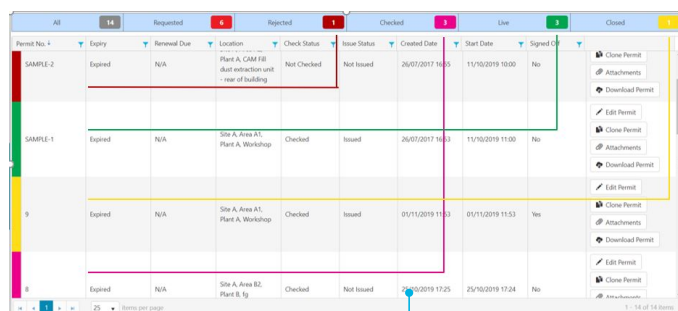

Devices: IAMPermit is a web-based software solution that can be accessed from any device, so site operators and engineers can check, update or sign onto their permit using their mobile or tablet whilst out in the field.

Isolations: Unlike many competitors, we include Isolations in the Permit software at zero additional cost. IAMPermit's Isolations module enables you to manage the entire isolation and de-isolation process.

Anti-clash & Map: This allows you to avoid site congestion by automatically running an anti-clash test on all permits, warning you if other work is scheduled at the same time for the same location. The map feature shows active permits on site, enabling a visual overview of any clashes, which is particularly useful for SIMOPS planning.

Visual/colour coding/ dashboards: Understand at a glance how far through the process each permit is. Colour coding, filterable permit grid, and archive libraries enable you to visually display every permit.

Data such as permit status, imminent renewals, and permit counts by contractor, is shown across a range of charts. Each widget can be exported to excel for reporting & further KPI analysis.

Colour coded dashboards allow you to see all your permits and their current status at a glance.

Permit Type(s)

Note that checking/unchecking will result in questions for that permit type being added to or removed from the area at bottom of this screen.

- ☐ Asbestos
- ☒ Confined Space
- ☐ Electrical
- ☒ General Work
- ☐ Hot Work
- ☐ Lifting Operations
- ☐ Working At Height

Create and search an unlimited amount of permit types.

Training and interactive tutorials: To get maximum benefit from IAMPermit, we offer training as well as interactive tutorials embedded into the software guiding users through each stage of the permit process.

Unlimited permit / work types: There is no limit to the number of work (permit) types that can be created. You can also select more than one permit type to cover the work taking place onsite. For each permit type selected, an editable list of risk reduction measures will be displayed for the user to consider.

Templates / cloning: This is a favorite feature of our clients as it saves time by allowing them to save permits as a template or clone existing ones for re-use.

Admin: Administrators can make behind the scenes amendments to the software such as changing their location hierarchy, adding additional permit or isolation types, adding users, modifying access rights and more.

Print/download/attachments: Download your permit as a PDF at any stage to print, for physical signatures for sharing via email. Permit attachments will also be printed as part of the permit certificate, e.g. plot plans, photographs, RAMS certificates and method statements.

Price: Unlike our competitors, we advertise our prices and include hosting upgrades and support.

IAMPermit is as capable as the permit software from our competitors and is available for a significantly lower price.

Visit our website for latest pricing information.
